(1) 周辺分布について、

$$P(A + 1) = P(A + 1, B + 0) + P(A + 1, B + 1) = P_{10} + 0$$

$$P(B_{t}=1) = P(A_{t}=0, B_{t}=1) + P(A_{t}=1, B_{t}=1) = P_{0, t} + \theta$$

金曜年にかって、

$$P_{00} = 1 - P_{11} - P_{10} - P_{01}$$

これらより、

$$P_{10} = \frac{1}{2} - \theta$$

$$P_{01} = \frac{1}{2} - \theta$$

$$L(\theta) = {n \choose m} (P_{00} + P_{11})^m (P_{01} + P_{10})^{n-m} = {n \choose m} (2\theta)^m (1-2\theta)^{n-m}$$

$$\frac{\partial \log L}{\partial \theta} = 0 \neq 0, \quad \frac{m}{\theta} - \frac{2(n-m)}{1-2\theta} = 0 \neq 0, \quad \hat{\theta} = \frac{m}{2n}$$

(3) 
$$\theta = \frac{1}{4}0 \pm 27$$
,

 $P\left(\frac{M - n \cdot (2\theta)}{\ln \cdot (2\theta) \cdot (1 - 2\theta)}\right) > 1.96 = \frac{2.5}{100}$ 
 $2535122302$ ,

 $C = 1.96 \cdot \frac{1}{2} \cdot \ln = 98$
